Do you want to live in a hot area? Or do you want a nice air conditioned house in the summer? This Earth, this world is getting hotter and hotter every year. Did you know that every year the temperature goes up by 4°C . If you think that's not much then hear this. In the year 2100 the Earth will not have green forests and green parks but a dusty, clear and spooky landscape. Imagine if you were in the year 2100...

Do you like paper then do you hate oxygen. Every year more than millions and millions of trees get chopped off by humans. The most important element for a human to survive is air given by trees. Trees give it by breathing carbon dioxide and breathe out air. Even if we cut trees for paper and furniture, who will use all these things when the population is getting lower of humans. Earth is getting hotter. would

Name: Atharv Palsodkar

you like to live in a place without oxygen?

Harmful, homeless, high waters cover homes of poor and kind people. If we don't act now, by 2030 Earth will have flooding because of Antarctica and the North pole, ice will be melted and dropped into the sea. Also the poor people's houses. Albert Einstein once said "The world will not be destroyed from who are evil but by those who watch and do nothing."

We need to keep our Earth happy, We need to reduce plastic, we need to stop cutting trees, but the most important is reduce of using big amounts of greenhouse gasses or the Earth will become a of rock orbiting the sun with no life no water no humans. This is our chance to stop this from happening.

Once Mohandas Charamchand Gandhi said "Earth provides enough to satisfy every man's needs but not greed."

When we burn greenhouse gases, they go into our atmosphere and make the blanket warmer made of methane and carbon dioxide, when they enter the blanket, the blanket gets bigger and bigger until it gets very hot on Earth. Greta Thunberg once said "We have run out of time, and excuses, we are here to save this planet."
